"Wind Breaker" to Reduce TMR
in a Ditch Drone

Best Available Copy

A wind breaker is a counter
on the top cover or on the
back of a ditch drone.
It's function is to reduce ditch
flutters and/or suspension damage
due to windage. It will shield
the heads and create a buffer
area of operation where it is
relatively "quieter" compared to
other areas of the ditch
surface. It will extend from the location
where spigots and the head are
down about 10 ft. location of it
will follow the edge of the air

The shape and location of the wind breaker
may be different. It should be
optimized after collecting data.
